Keywords : Image processing, computer graphics, computer vision, MATLAB

Image processing is a process of signal processing for which input is an image such as photograph or video signal and the output of image may be either an image or set of characteristics or parameters related to the image. Most techniques of image-processing techniques involve treating the image as a two dimensional signal and applying signal processing techniques to it. It usually refers to digital image processing but both optical and analog image processing are possible. In computer graphics, images are usually made from physical models of objects, environments, and lighting, whereas, in computer vision, image is often part of high-level processing in which a machine or computer or software intends to decipher the physical contents of an image or a sequence of images. For example, videos or 3D full-body magnetic resonance scans. To carry out processing of different image, we generally use image processing algorithms. The various image processing algorithms such

as image rotation, image registration, image deblurring, etc., are explored in this study.

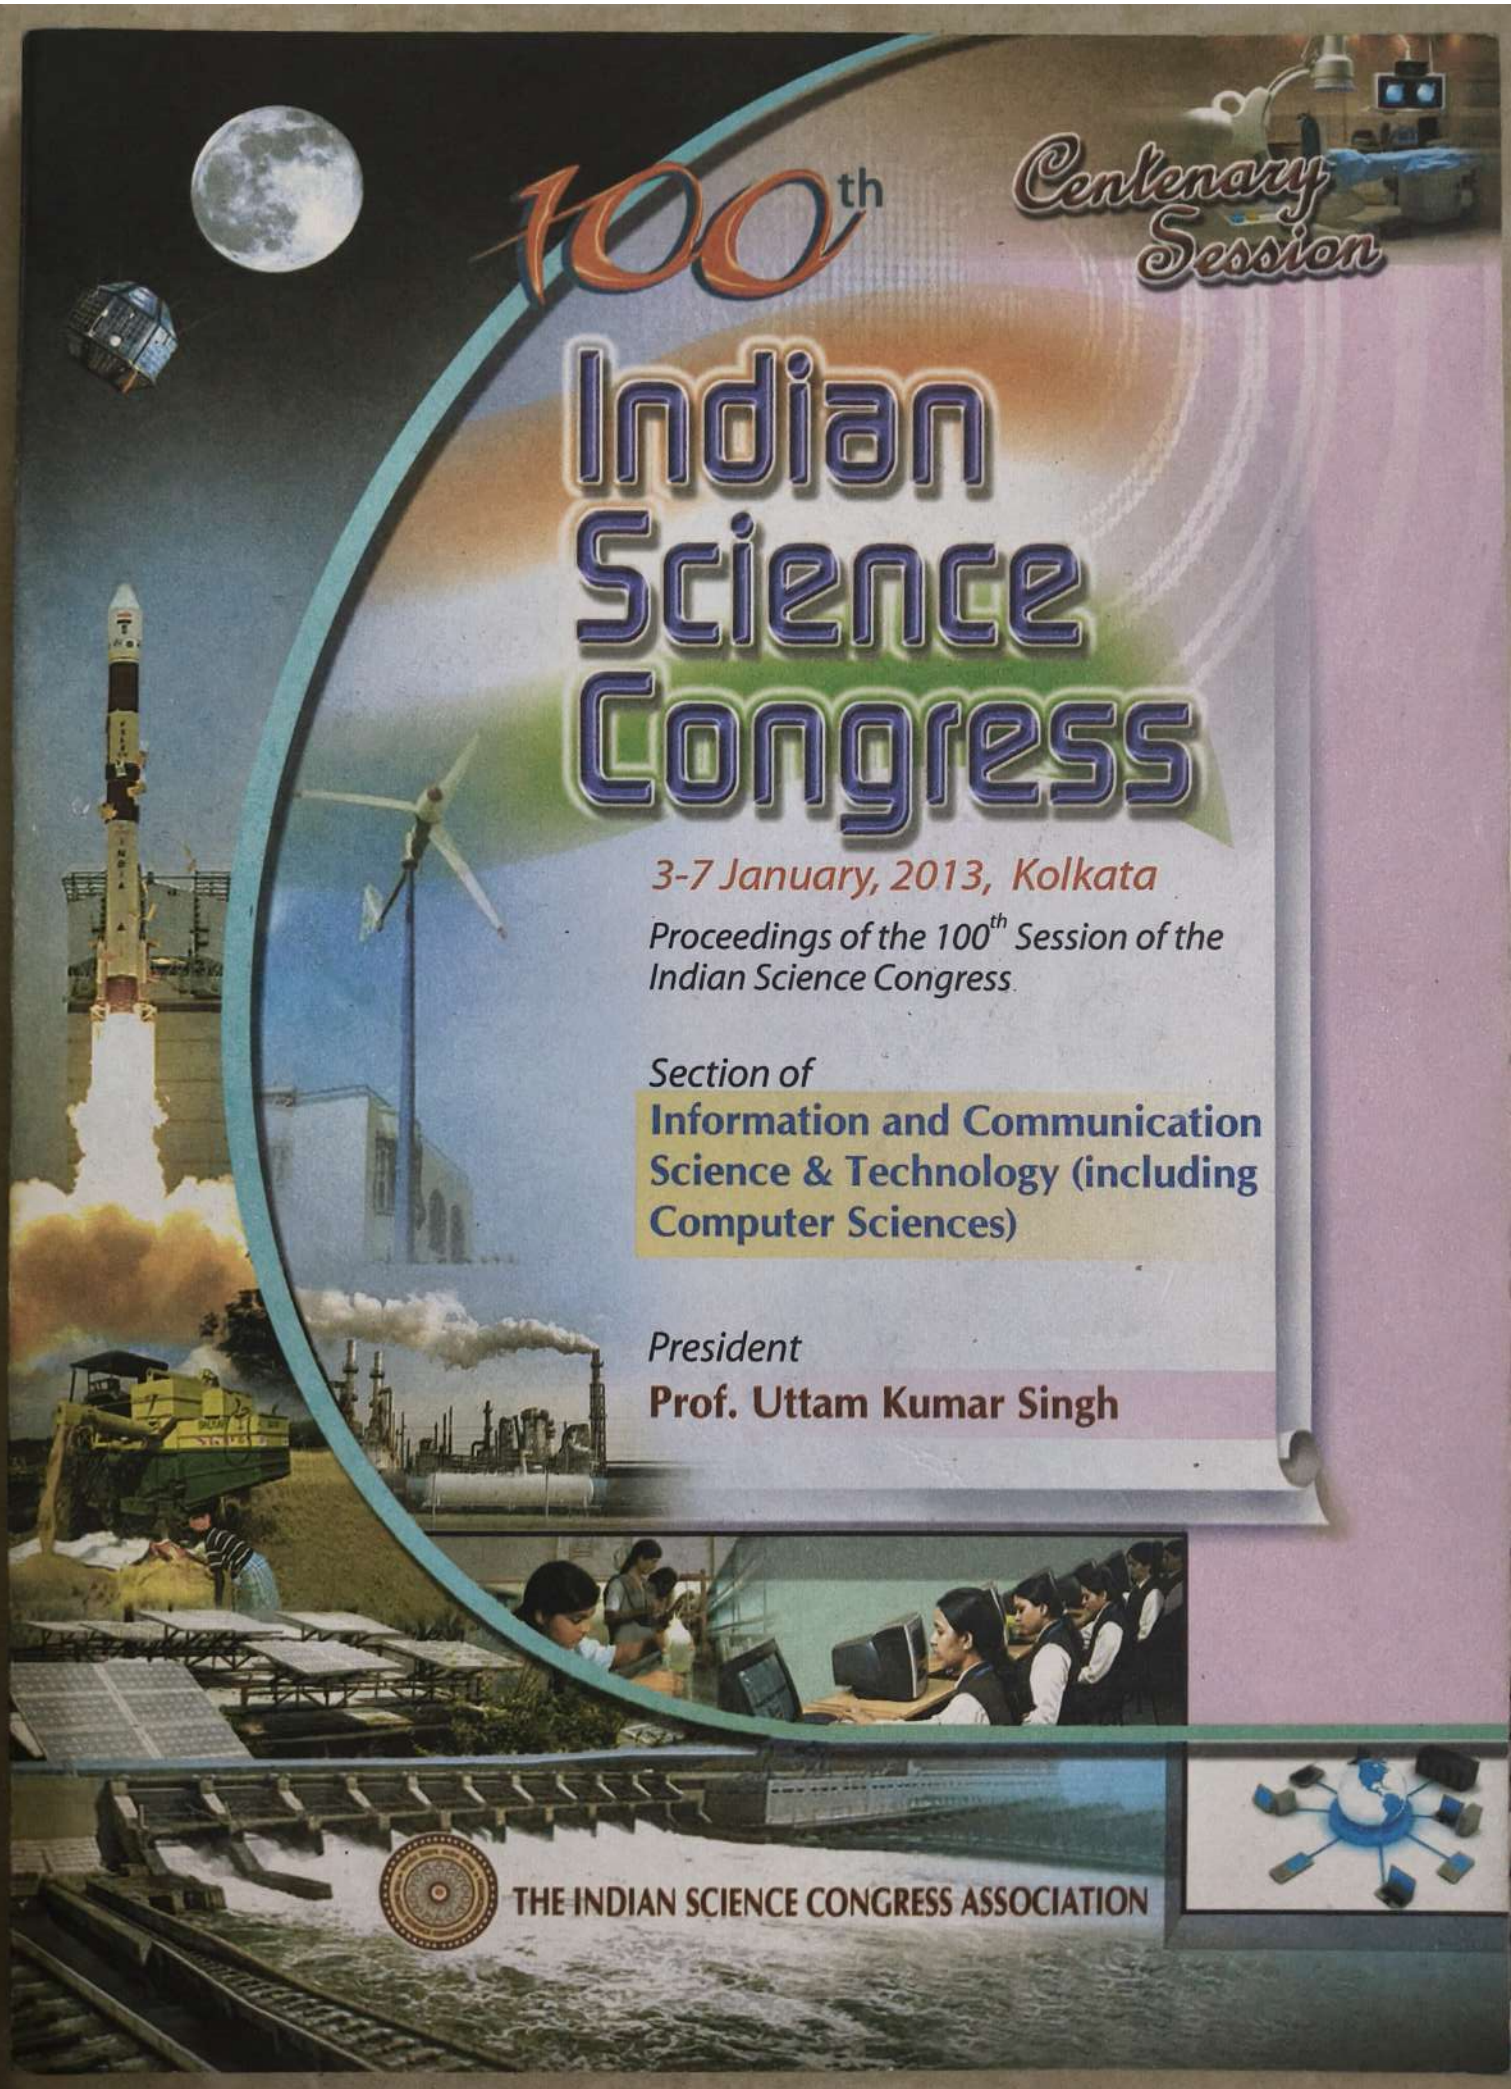

64. Recent Trends and Challenges in Design of Wireless Network-on-Chips

Keywords : Wireless interconnect, Wireless Network on chip (WiNoC), System on chip (SoC), Low power NoC

To meet the increasing demands for the on chip communication to support todays high performance computing requirements, network-on-chip (NoC), is the subsystem that provides connectivity between cores and other components for efficiently transporting data in minimal time, high volume, and least energy. But this technology has some limitations for long distance multihop communication between cores. This limitation can be addressed by Wireless NoC architecture for long range, high bandwidth, and low power on-chip communication. In this paper, we have investigated recent trends and challenges in designing wireless network-on-chips. Lots of open research problems are detected and reported. This paper also investigates regarding the future of possible wireless NoC architectures.

100th

Centenary Session

Indian Science Congress

3-7 January, 2013, Kolkata

Proceedings of the 100th Session of the Indian Science Congress

Section of

Information and Communication Science & Technology (including Computer Sciences)

President

Prof. Uttam Kumar Singh

THE INDIAN SCIENCE CONGRESS ASSOCIATION
