Keywords: Android, Apache Tomcat, JSON, PHP, MySQL, Population Census 2011

Abstract

In traditional approach, the population census work was done using paper and pencil. Personnel has to go mile away to get this job done. Using this mobile apps, both user or personnel would get benefit in near future to come. Here, we are demonstrating this apps. First of all user or operator fill the enrollment form on mobile. After filling the enrollment form, the user will save the data using save button. Now if the user wants to check the details, then the user has the option to check his/her details using check button. Then whatever he/she had entered on the enrollment form, it will get displayed on his/her mobile phone/s. After assuring oneself, the details are correct, the user will click on save button to save the data on webserver. This is the first part. Here , the IP address should be unique. Second part comes webserver. In this we are using the MySQL, php, webservices, JSON format, etc. When the data is saved to the server, then the php will first encode the data in json array format([]) and then using webservices, it will save the data in MySQL database as it is as the user or personnel had entered from respective mobile phone/s. Third part comes operation and maintenance system. It will assist both user and personnel when facing the problems entering the enrollment form. From this apps also, user can call the respective maintenance personnel contact number already built in this mobile apps for particular region or location. Through operation and maintenance system, these data can made available to various government/non-government/ or etc so that the various government schemes can be provided to each and every personnel of this country or any other country. Also, there is provision of enumerator login so that according to the particular region or location he/she can check whether the enrollment process is running smoothly or not. After the whole process is over, the data will not be saved permanently on user's mobile phone. This enrollment form will be multilingual so that this apps can reach to people around the globe so that it can be filled easily and quickly and submitted there after. The advantage will be super as the manpower required will be less, the initial set up cost will also be less. The time saving is there. The money spent will be in lakh instead of crore. If this mobile apps is successfully implemented, then the population census or any other census can be done within the five year span and another five years to implement the various government schemes. We will kept one prototype and use the same in various enrollment form or any other form, etc. I must call it as Whatever and whereever mobile app (WWMA).
